

Customer Churn Prediction Project

Scenario

A telecommunications company has approached us with a problem of customer churn in their business. The business owner has provided us with some data to work on. Our task is to provide recommendations to the company to effectively solve the problem of customer churn. To do this, we will be working in the Google Collab environment using PySpark to develop a ML model based on a decision tree algorithm that will identify the factors that contribute to customer churn. We will then provide actionable insights to the company to reduce customer churn and increase customer retention.

Goals:

- ✓ Identify key factors contributing to customer churn
- ✓ Build an effective ML model using Decision Tree Algorithm
- ✓ Deliver actionable insights to improve customer retention

Project Workflow:
